MF: WORKING PRINCIPLE

The electric motor (B) transmits its power by means of a reducer, made up of a pinion (E) and a ring gear (F) solidary to an axis (I) and an eccentric (A) that alternatively pushes and draws a shaft (C) threaded to a piston (D).

As a spring is not necessary for the return of the piston (**POSITIVE RETURN**), the motor transmits all its power both to the injection and to the suction, saving energy, avoiding breackdowns, and ensuring a perfect and high precision dosing.

The micrometic regulator **(G)** increases or diminishes the stroke of the shaft and the piston by means of a threaded pipe coupling **(H)**, modifying the injection flow. The dosing flow is adjustable from a 0% to a 100%.

To regulate flow by means of an inverter is possible varying proportionally the dosed flow by the frequency supplied by an electric motor. The dosing flow is adjustable from, a 10% to a 100%.
